Optimal Plan for Problems

Breadth-first search is optimal if the path cost is a non-decreasing function of the depth of the node. The most common such scenario is that all actions have the same cost. BFS finds an optimal solution as explained in AIMA book, Stuart Russell and Peter Norvig, 3rd edition, pp 82. Also we can assure that BFS will return the optimal plan for any problem because there is a mathematical proof about that. (Refer - <https://cs.stackexchange.com/questions/16758/artificial-intelligence-condition-for-bfs-being-optimal>) All the given optimal paths are provided through Breadth First Search execution.

Table-1 – Uninformed Non-Heuristic Search Result Summary

Nodes Expansion Analysis

Required memory/space and execution time increases with increasing number of expanded nodes. Least number of nodes are expanded by DFS then by BFS and then by UCS

For all the given problems - **Number of nodes expanded** is in the order

UCS > BFS > DFS

Time Elapsed Analysis

Required processing/execution time is directly impacted by the number of nodes expanded. Least time is taken by DFS then by BFS and then by UCS

For all the given problems – **Time elapsed** is in the order

UCS > BFS > DFS

Optimality Analysis

DFS is faster and expands fewer nodes than UCS, BFS but it does not provide optimal path, whereas both UCS and BFS provide optimal paths with best/least possible path length.

Optimality for Uninformed non-heuristic search methods is given below –

BFS : **Optimal**

DFS : **Not Optimal**

UCS : **Optimal**

Heuristic Search

Search Result Summary

A-star search executed with - null heuristic (h₁), ignore precondition heuristic (h_{ignore_preconditions}) and levelsum heuristic (h_{pg_level_sum}). Summary of search execution result is given in the Table-2 below.

A-Star Search	air_cargo_p1					
	Expansions	Goal Tests	New Nodes	Path Length	Time elapsed	Optimal
null heuristic	55	57	224	6	0.178929908	Yes

Table-2 – Heuristic Search Result Summary

Nodes Expansion Analysis

Required memory/space and execution time increases with increasing number of expanded nodes. While executing A* search least number of nodes are expanded through levelsum heuristic (h_{pg_level_sum}) then by ignore precondition heuristic (h_{ignore_preconditions}) and then by null heuristic (h₁)

For all the given problems - **Number of nodes expanded** in A* search through different heuristics is in the order -

h₁ > h_{ignore_preconditions} > h_{pg_level_sum}

Time Elapsed Analysis

Required processing/execution time is directly impacted by computation complexity of heuristic method and the number of nodes expanded. A* search execution with ignore precondition heuristic (h_ignore_preconditions) is the fastest as it takes the least time followed by null heuristic (h_1) followed by levelsum heuristic (h_pg_level_sum)

For all the given problems – **Time elapsed** in A* search through different heuristics is in the order -

h_pg_level_sum > h_1 > h_ignore_preconditions

Optimality Analysis

Executing A* search with all the given heuristic methods provides optimal paths with best/least possible path length.

Optimality for heuristic search methods is given below –

null heuristic	:	Optimal
ignore precondition heuristic	:	Optimal
levelsum heuristic	:	Optimal

Best heuristic

Among all the given heuristic methods **ignore precondition heuristic (h_ignore_preconditions) is the best heuristic.**

Ignore precondition heuristic **provides the optimal path and is the fastest** among all the given heuristic methods. If we compare with uninformed non-heuristic search methods then DFS is faster than h_ignore_preconditions but DFS is not optimal.

Level sum heuristic is also optimal and expands fewer nodes than h_ignore_preconditions but level sum heuristic has higher computational complexity which makes it slower than h_ignore_preconditions
